

Fairfax Bridge Rehabilitation Project

Project Update

March 7, 2014

Creek Road Bridge and Meadow Way Bridge – Upcoming Geotechnical Borings

The Town of Fairfax is currently engaged in a bridge rehabilitation and retrofit project. Creek Road Bridge and Meadow Way Bridge are two of the bridges being assessed.

As part of this assessment, on Thursday, March 13th, engineers and technicians working on the project will be drilling small diameter holes to sample the soils at both bridges in order to better understand the condition of the ground.

The boring at Creek Road Bridge consists of drilling a single 4 inch diameter bore hole in the dry gravel bar on the north (downstream) side of the bridge.

Testing at Meadow Way Bridge involves re-tapping one of the previously drilled borings.

The engineers plan to start at Creek Road Bridge in the morning and then move to Meadow Way in the afternoon.

If storms occur just before or on March 13, causing runoff, the borings will be rescheduled.
